

FAQ - VMInformer Tool Options

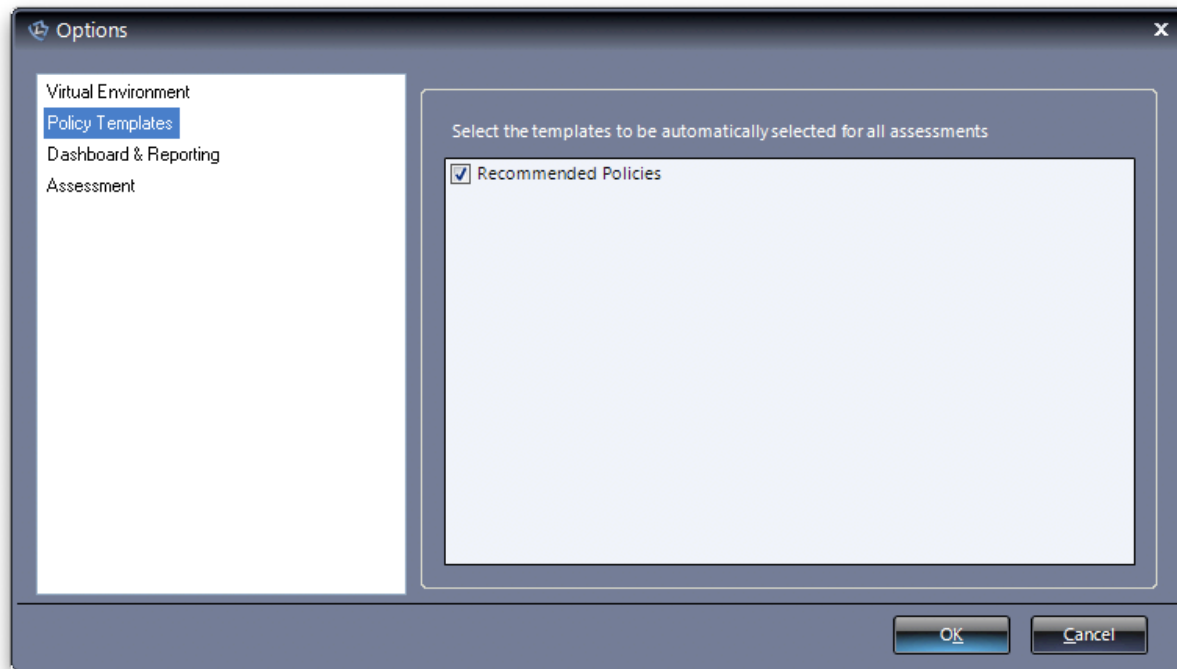

This FAQ details the various option available from the Tools Menu of the VMInformer Assessment tool.

Virtual Environment

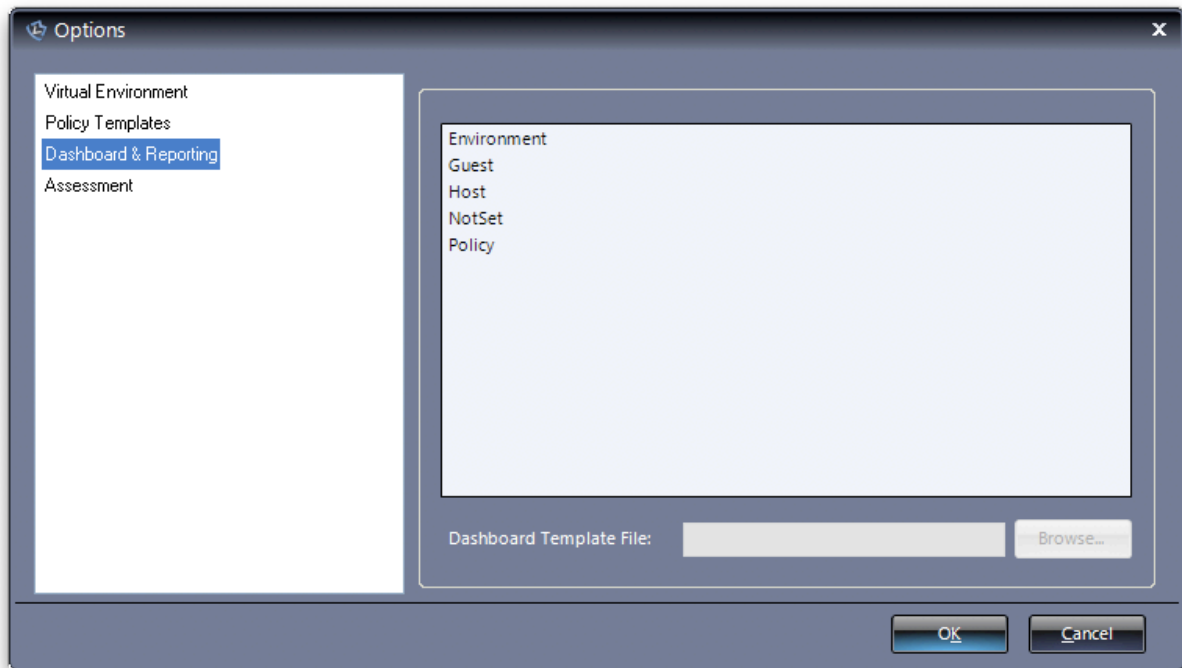

The show certificate warnings checkbox allows you to suppress certificate warnings when you connect to your VC or ESX host. Deselect to remove warnings.

Policy Templates

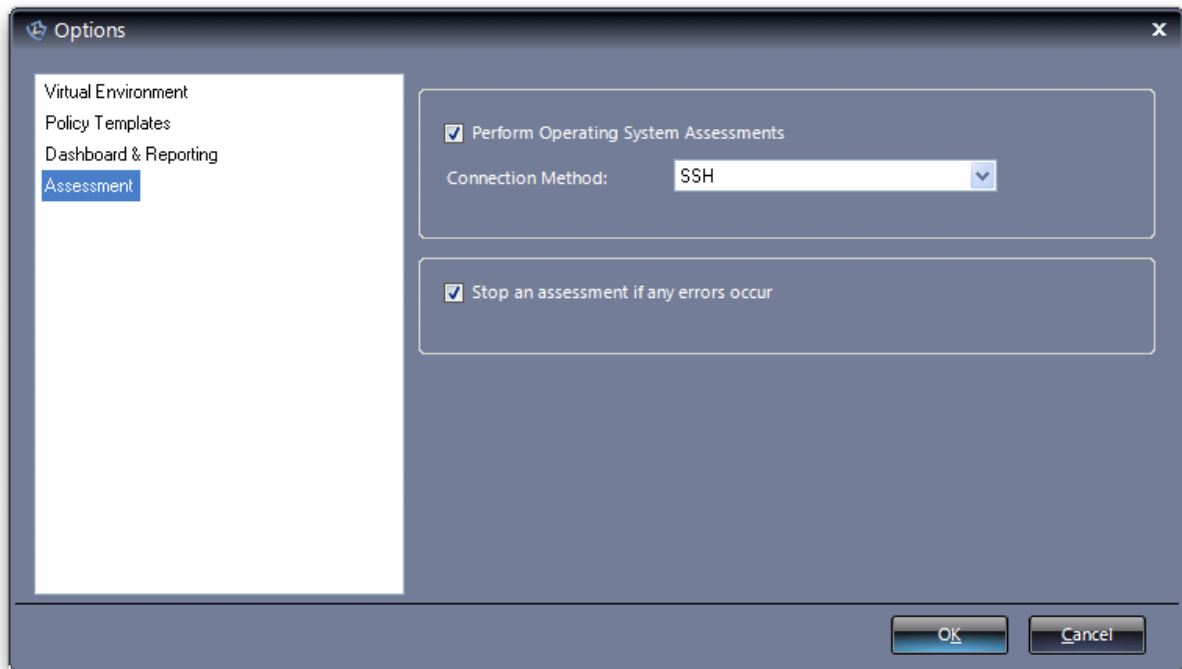

The Policy Template option allows you to select the policies you want automatically selected during the assessment.

Dashboard and Reporting

The Dashboard and Reporting options allows you to change the location and various reports that are used by the tool. The reports are in RDLC format so can be exported to other applications like excel.

Assessment

The Assessment option controls the operation of the assessment process. It allows you to disable or enable (default) the various operating system checks.

The tool will by default stop if an error occurs during the assessment. Again this feature can be disabled.
